Highlights on 2018 ECEIM congress

Anne Couroucé

FINAL DISCLOSURE:

I will discuss results of clinical trial which were supported by Pharmaceuticals laboratories

UNLABELED/UNAPPROVED USES DISCLOSURE:

I will discuss results of clinical trial for various agents that are currently NOT approved for use in animals.

INTRODUCTION

- Ghent, Belgium, 9-10th November 2018
- 2 ACVIM residents:
 - Rebecca M. Legere
 - Callum G. Donnelly
- 2 ECEIM residents:
 - Anne Bohlin
 - Tobias Warnken

INTRODUCTION

- Anna Bohlin is a resident in Helsingborg (Sweden), supervised by Gaby van Galen. The work awarded here is titled:
 - ASSESSMENT OF AN AMERICAN NEONATAL FOAL SURVIVAL SCORING SYSTEM IN A DANISH-SWEDISH POPULATION
 - Anna Bohlin¹, Anna Öhman¹, Emma Karlsson², Alexandra Sånge², Katarina Nostell³, Inge Durie⁴, Louise Husted⁵, Claude Saegerman⁶, Gaby van Galen²
- Tobias Warnken is a resident in Hannover (Germany), supervised by Karsten Feige. The work awarded here is titled:
 - SELECTION OF ASSAY FOR QUANTIFICATION OF EQUINE INSULIN AFFECTS RESULTS OF ORAL GLUCOSE TEST AND COMBINED GLUCOSE-INSULIN TEST IN HORSES
 - T. Warnken¹, M. Schmicke², K. Huber³, K. Feige¹

Prospective evaluation of the accuracy & diagnostic ability of a smartphone-ECG in horses

I. Corradini, A.Fernandez-Ruiz, J. Engel-Manchado

*Departamento de Medicina y Cirugía Animal, Universidad
CEU Cardenal Herrera, Valencia, Spain*

Objectives

To validate a smartphone enabled electrocardiograph (SpECG) comparing it to a standard base-apex ECG (ECG) for the detection of spontaneous arrhythmias in horses

To evaluate the diagnostic ability & accuracy of the SpECG for the measurement of the duration of cardiac electrical events in horses.

- 1-minute ECG tracings:
 - SpECG & ECG simultaneously
 - SpECG on both sides of the thorax
- Horses with & without spontaneous arrhythmias
- Tracings evaluated by 2 blinded observers
 - Quality & interpretability of recordings
 - Presence & classification of arrhythmias
 - Duration of P-wave, PR-interval, QRS-complex and QT-interval (ms)

- 50 horses 1mo to 32yo were included

ECG

SpECG

Results: agreement between devices

| | Overall α [CI ₉₅] p | Left side α [CI ₉₅] p | Right side α [CI ₉₅] p |
|--------------------|---|---|--|
| P wave | <i>High</i> 0,70 [-0,12-0,76] <0,00 | <i>Low</i> 0,18 [-0,29-0,48] <0,19 | <i>High</i> 0,76 [0,64-0,84] <0,00 |
| PR segment | Very high 0,87 [0,83-0,90] <0,00 | Very high 0,89 [0,83-0,93] <0,19 | Very high 0,87 [0,80-0,91] <0,00 |
| QRS complex | Low 0,18 [-0,08-0,38] <0,08 | High 0,70 [0,35-0,77] <0,00 | Low 0,14 [-0,26-0,41] <0,23 |
| QT segment | High 0,70 [0,28-0,74] <0,00 | Medium 0,66 [0,20-0,76] <0,00 | Medium 0,60 [0,22-0,71] <0,00 |

SpECG:

- Was a useful arrhythmia-screening tool
- Was accurate
- Better if recorded on both sides of thorax
- Lower wave amplitude
 - SpECG should not replace standard ECG

CARDIAC RESEARCH

Structural Remodelling in the Equine Heart after Pacing-Induced Atrial Fibrillation

**Helena Carstensen, Eva Zander
Hesselkilde, Ditte Dybvald
Kruse, Thomas Hartig
Braunstein, Thomas Jespersen
and Rikke Buhl**

*Department of Veterinary Clinical
Sciences, Faculty of Health and
Medical Sciences, University of
Copenhagen.*

Aim

To assess structural remodeling of equine heart after AF

- Quantify fibrosis in the atria and ventricles
- Inter-atrial differences

Study outline and methods

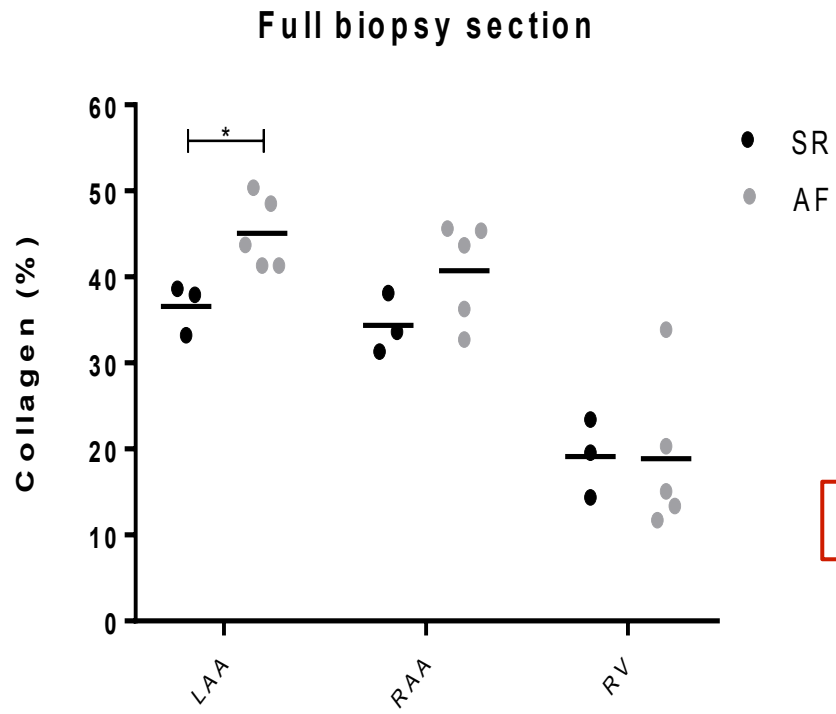

*ECG, echocardiography and flecainide infusion (2mg/kg). AF re-induction if cardioversion

°Atrial fibrillatory rate recordings

- 8 Standardbred mares:
- 5 AF horses, 3 controls
- Age: 10.4 ± 4.7 years, mean body weight 475 ± 47 kg
- Pacemaker implanted w/ two leads in right atrium
- Histological assessment of fibrosis: Staining with Picro-Sirius Red for collagen (I and III), scanning in brightfield and analysis with ZEN Intellesis segmentation tool

Results - Full biopsy section

LAA

- SR
- AF

RAA

Conclusions

- Increased amount of fibrosis in the left atrium of the AF group
- A similar tendency in the right atrium of the AF group
- No difference in ventricular fibrosis between AF and control group
- Picro-Sirius red staining combined with ZEN intellesis valid method for fibrosis quantification in horses
- ✓ AF causes structural remodelling in horse atria

CARDIAC RESEARCH

Implantable loop recorders for arrhythmia detection in horses – a new promising diagnostic tool

Rikke Buhl^a, Eva Z Hesselkilde^a, Helena Carstensen^a, Merle Fenner^a, Thomas Jespersen, Jacob Tfelt-Hansen^b, Stefan M Sattler^b

^a*Department of Veterinary Clinical Sciences, Faculty of Health and Medical Sciences, University of Copenhagen*

^b*Department of Cardiology, The Heart Centre, Copenhagen University Hospital*

Challenges

- Short lasting or paroxysmal atrial fibrillation (AF) difficult to diagnose
- Relapse of AF after cardioversion difficult for owner to perceive

Cardiac Loop Recorder – A one lead ECG implanted subcutaneously

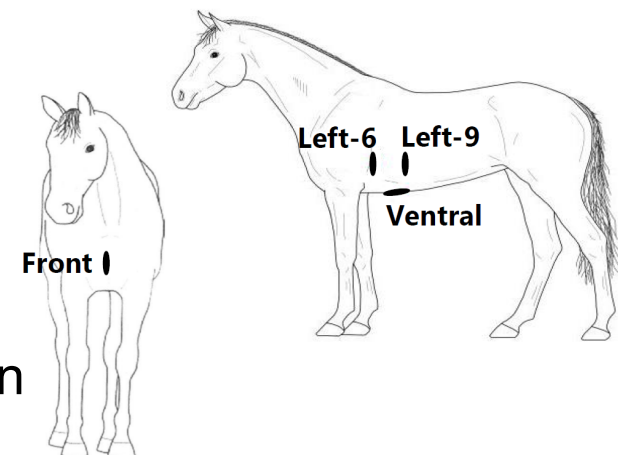

A new way to diagnose AF episodes

Store automatically predefined arrhythmic events (ie. AF)

Aim of the study

- Is it possible to use Implantable Cardiac Loop Recorder for detection of AF?
- Evaluate best anatomical position for registration of AF in four horses with induced AF

Results and Conclusion

- All Loop Recorders were successfully implanted without complications
- Operation time < 5 minutes
- All Loop Recorders could detect AF
- Left position (Left-6) had significantly higher R and T waves compared to the remaining positions
- Poor quality during exercise

CARDIAC RESEARCH

FIRST SUCCESSFUL RADIOFREQUENCY ABLATION OF FOCAL ATRIAL TACHYCARDIA IN A HORSE GUIDED BY A HIGH DENSITY 3D ELECTRO-ANATOMICAL MAPPING SYSTEM (RHYTHMIA®)

G. Van Steenkiste¹, M. Duytschaever², D. De Clercq¹, R. Tavernier²,
L. Vera¹, A. Michielsen³, A. Decloedt¹, S. Schauvliege³, G. van Loon¹

1. Equine Cardioteam, Department of large animal internal medicine, faculty of veterinary medicine, Ghent University, Belgium
2. Department of Cardiology, AZ Sint-Jan, Bruges, Belgium
3. Department of Surgery and anaesthesiology of domestic animals, faculty of veterinary medicine, Ghent University, Belgium

PATIENT

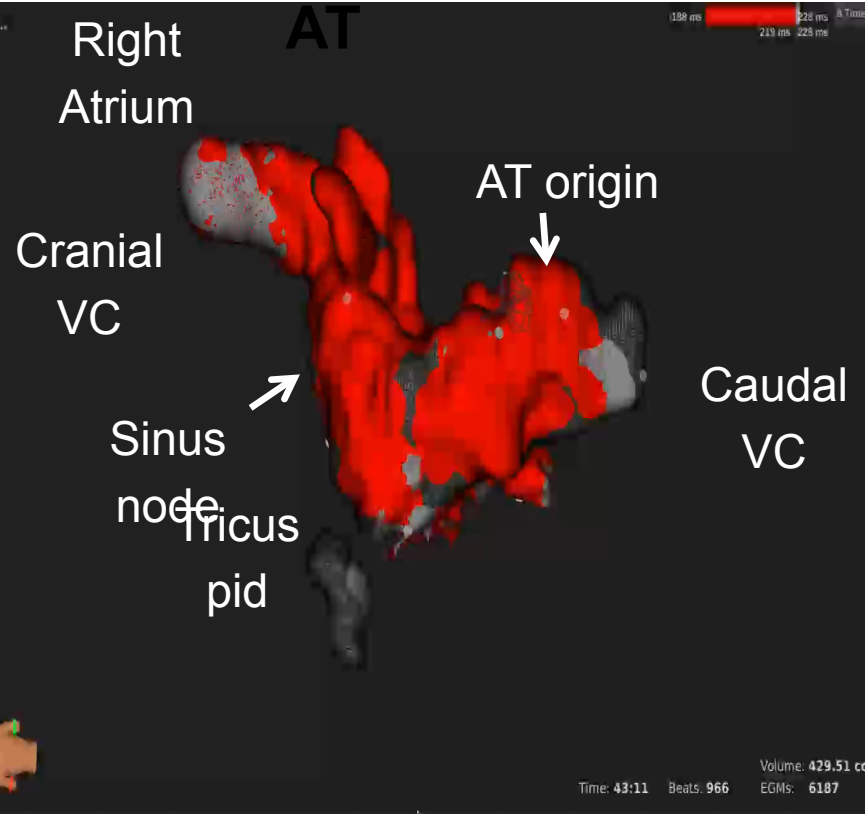

- 5 year old showjumping stallion
- AF has been treated with Quinidine but converted to AT
- Has been cardioconverted to SR 3 times (2 x TVEC, 1 x Quinidine)
- 3 months after last cardioversion: again recurrence of AT

3D ELECTRO-ANATOMICAL MAPPING

Sinus

Focal

ABLATION

Intellanav OI (boston scientific)

- SR after 5th ablation
- In total 9 ablation locations
- Pacing did not induce AT afterwards

DISCUSSION

- AT treatment : not well described
 - Usually similar as for AF? (QS or TVEC)
 - Recurrence ?
- Human medicine:
 - High recurrence (99%!)
 - Always ablation: permanent solution
- Current case
 - Focal AT possible source for AF
 - Ablation: possible treatment for some horses with AF?

RIGHT ATRIAL RELATED STRUCTURES IN HORSES, OF INTEREST DURING ELECTROPHYSIOLOGICAL STUDIES

L. Vera, D. De Clercq, G. Van Steenkiste, A. Decloedt, B.
Deserranno, G. van Loon

Equine Cardioteam, Department of Large Animal Internal Medicine, Faculty
of Veterinary Medicine,
Ghent University, Belgium.

AIM

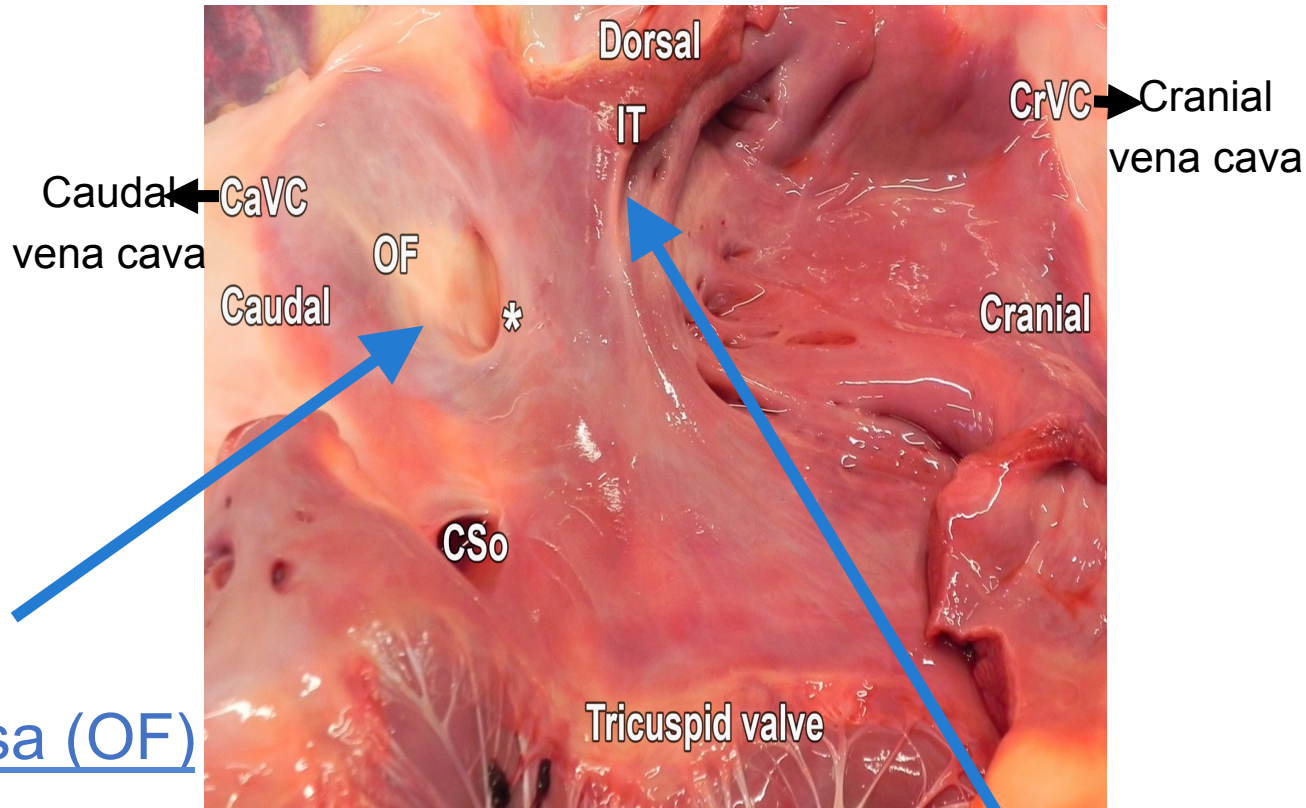

- ❑ Catheter-based electrophysiological studies
 - diagnose and treat specific cardiac arrhythmias in horses
- ❑ To develop and standardise
 - detailed anatomical knowledge is necessary
- ➔ Investigate important right atrial related structures

MATERIALS AND METHODS

15 Warmblood horses

- ❑ Measurements: *post mortem*
- ❑ Mean (\pm SD) body weight = 539(\pm 74) kg
- ❑ Mean cardiac weight was 4.2(\pm 0.8) kg

RESULTS

Oval fossa (OF)

Transseptal puncture

→ Gain access to LA and LV via a RA approach.

□ Size: 29(±3) mm x 59(±9) mm

Intervenous tubercle (IT)

A large, prominent structure

→ Might hamper catheter positioning

RESULTS

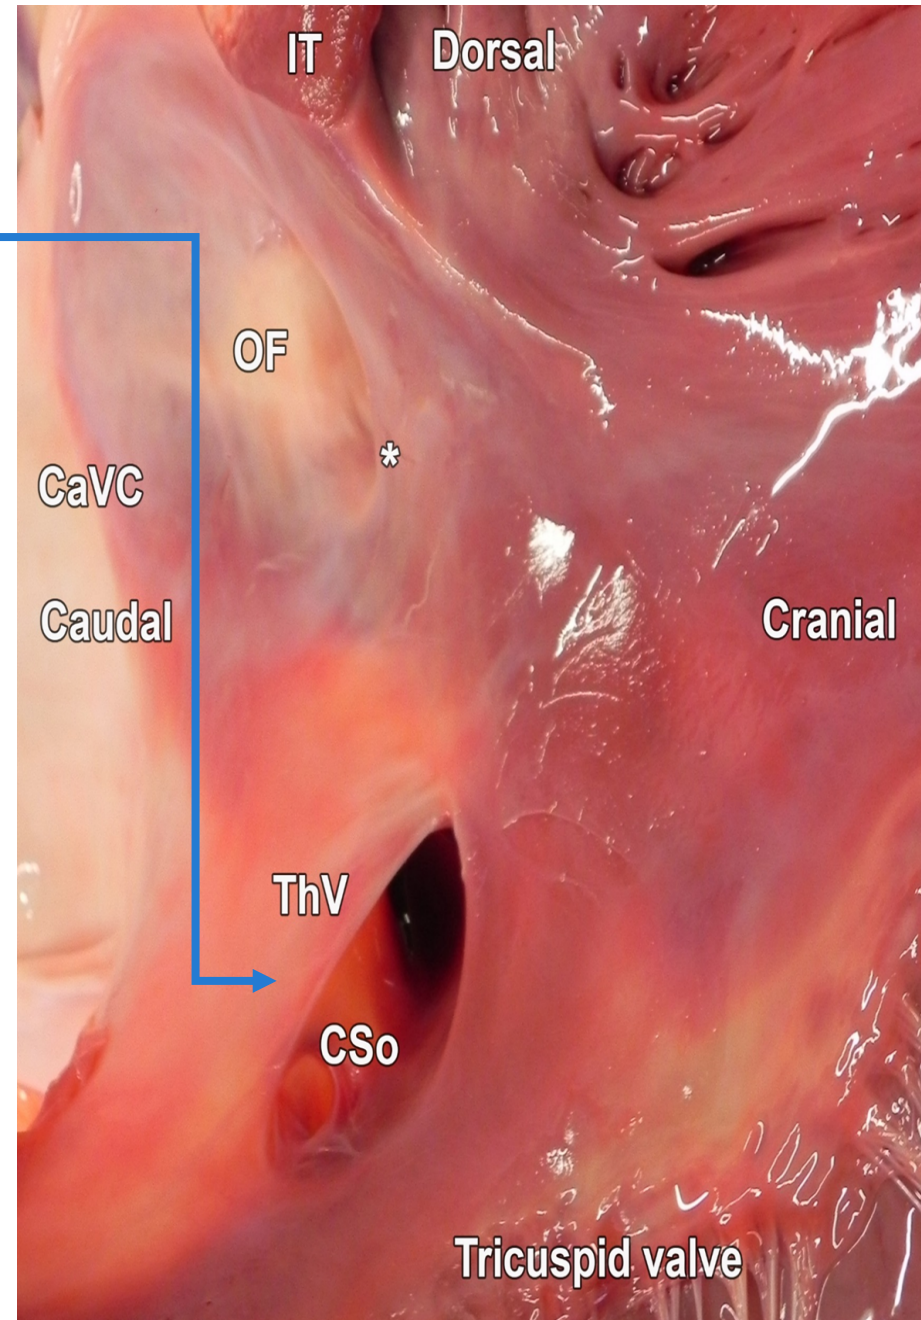

Coronary Sinus

Catheterisation of **CS** and **great cardiac vein (GCV)** → electrical information about LA and LV via a RA approach

□ Size **CS ostium (CSo)**: $28(\pm 3)$ mm

→ Presence of (Thebesian) valve in 3 horses

→ Median of 5 additional valves in GCV

CONCLUSION

- ❑ **Large size of intervenous tubercle** → likely to hamper **transseptal puncture** through the oval fossa via a cranial vena cava approach
- ❑ Presence of a **valve at the entrance of the coronary sinus** in some horses, and especially the **large number of additional valves** over the entire length of the great cardiac vein in all horses → **difficult catheterise CS and GCV**

CARDIO-VASCULAR RESEARCH

CATHETER-RELATED VENOUS DISEASE IN HORSES: INCIDENCE, RISK FACTORS AND BACTERIAL CORRELATION

Petr, Soukup¹, Barbora Bezděková²

¹Equine Clinic, University of Veterinary and Pharmaceutical Sciences Brno, Czech Republic

*¹Equine Department, Section of Ophthalmology, Vetsuisse Faculty, University of Zurich,
Switzerland*

²EQUINE MEDICAL, Jabloňany 77, 679 01, Skalice nad Svitavou, Czech Republic

Aim of the study

- To determine incidence of catheter-related venous disease, i.e. phlebitis, periphlebitis, thrombophlebitis, and evaluated risk factors associated with this disease in long-term intravenously catheterized horses

Three examples of v.jugularis pathology on horizontal and transversal views

Material and methods

- 125 cases of catheterized veins from 117 patients were repeatedly evaluated clinically and ultrasonographically for signs of subclinical or clinical catheter-related venous disease.
- Possible risk factors and medical records data were evaluated.
- 92 catheter tips were aseptically removed and bacteriologically diagnosed.
- Antimicrobial sensitivity testing for all bacterial isolates was performed.

Results

- 16 veins suffered from clinical disease and 16 veins from subclinical progressive disease, incidence of clinically relevant catheter-related disease was 25,6% (32/125). 29,6% presented with subclinical non-progressive disease
- Risk factors associated with clinically relevant disease included endotoxemia, thrombocytopenia and colic as presenting sign (all $P < 0,01$)

Results

- 40 catheter tips yielded a positive culture results (43,5%) and clinically- relevant disease had significantly more positive cultures ($P < 0,01$)
- Most common isolates included coagulase-negative *Staphylococcus* (16) and *E. coli* (9)
- *Enterobacteriaceae* ($P < 0,01$), *E. coli* ($P < 0,05$) and coagulase-positive *Staphylococci* ($P < 0,05$) were found to be significantly more present in clinically relevant disease
- Seventeen multiresistant bacterial strains were isolated

Conclusion

- Significant risk factors (endotoxemia, thrombocytopenia and colic) could be used as indications for preventive ultrasonographic evaluation to decrease the rate of clinical disease and prevent possibly fatal complications.
- Multiresistant isolates stress the need to culture tips from diseased veins and could be used to determine first choice antimicrobial before the culture sensitivity results are available.

Dithiothreitol: Effect on interpretation of equine tracheal wash samples

Valerie Potts BVMS MRCVS, Royal (Dick) School of Veterinary Studies, University of Edinburgh

Background

- Cytological interpretation of tracheal wash (TW) samples can be impeded by excess mucus
- Dithiothreitol (DTT) is a potent mucolytic used in the processing of human sputum samples

Hypothesis: Treatment of TW samples with DTT will:

- Reduce background mucus on stained cytology slides
- Improve the “readability” of the sample
- Facilitate the recognition of cells preferentially trapped within the mucus, thus potentially influencing the differential cell count

Methodology

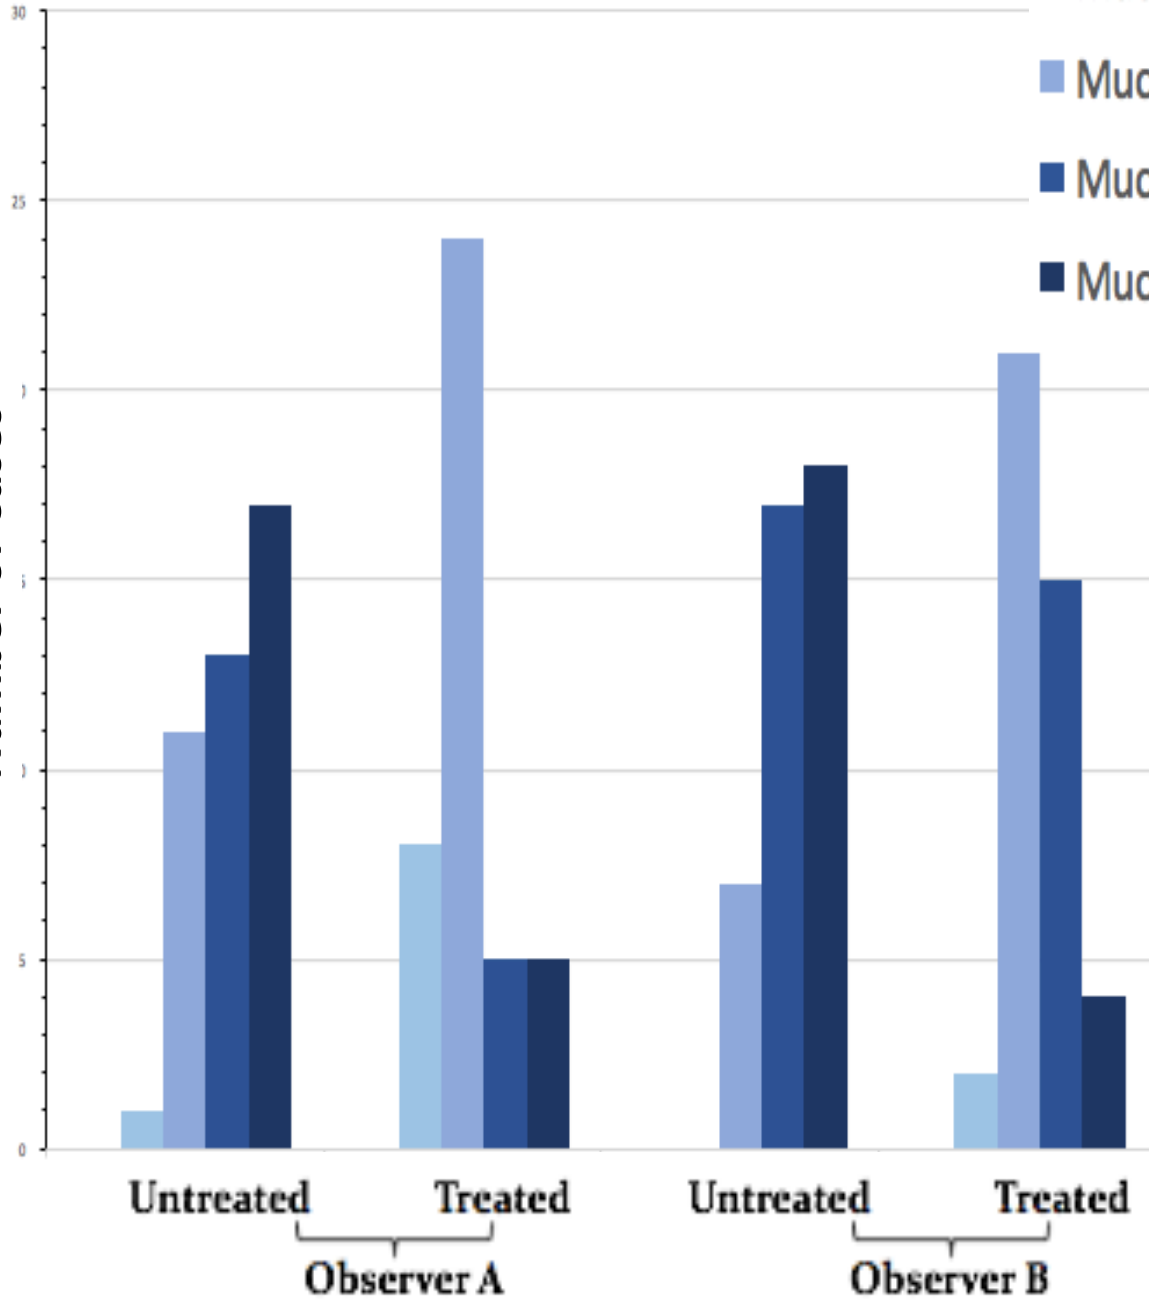

- 45 equine paired TW samples - 1 treated (DTT) & 1 untreated
- 2 blinded observers analysed tracheal wash cytology and mucus grade on slide

Mucus Grade

Number of Cases

- Mucus Grade 0
- Mucus Grade 1
- Mucus Grade 2
- Mucus Grade 3

Same Sample

Effect on differential cell count – influencing inter-observer agreement and disease categorization

| | Untreated | | DTT treated | |
|-------------------|------------|------------|-------------|------------|
| | Observer A | Observer B | Observer A | Observer B |
| < 20% neutrophils | 39 | 32 | 34 | 31 |
| > 20% neutrophils | 6 | 13 | 11 | 14 |

Intraclass correlation coefficient

Untreated - 0.61

DTT treated - 0.75

Conclusions

DTT

1. Significantly ($P < 0.001$) reduced mucus grade for both observers
2. Significantly improved inter-observer agreement, with regard to neutrophil %
3. Did not significantly alter neutrophil percentages
4. Did not significantly alter disease categorization
 - Non significant trend – requires larger study

RESPIRATORY

IN VITRO BACTERICIDAL EFFECT OF NEBULIZED SILVER ON TWO EQUINE COMMON RESPIRATORY BACTERIA

C. PAINDAVEINE, T. FRIPPIAT, J-N. DUPREZ, J. MAINIL, T. ART

Background

- Respiratory bacterial infections: gram-positive (mainly streptococci) and gram-negative (mainly *Actinobacillus/Pasteurella* spp.), possibly treated with systemic or aerosolized antibiotics
- Increasing antimicrobial resistance in bacteria
- **Silver:**
 - Antimicrobial action against gram-positive and gram-negative, viruses and fungi
 - Currently used in surgical sutures, wound dressings and medical devices

Aim of the study

1. to demonstrate the in vitro antimicrobial effect of silver on 2 common equine respiratory bacteria, *S. zooepidemicus* and *A. equuli*
2. the preservation of its in vitro antimicrobial effect after nebulization

Bacterial growth inhibition

- BHI/Columbia blood agar plate inoculated with bacteria, CFU after 24 hours incubation 37°C
- **Part 1 - Instillation:** 1 mL of silver complex (2000 and 100 ppm) or citric acid (chelator)
- **Part 2 - nebulization at 15 cm of the plates:** 2,5 mL of silver complex (2000, 1000, 500 and 100 ppm)
- Gentamicin (control +) or saline (control -) spread on plate

Part 1 - Instillation

Discussion and conclusions

Results of the study

- In vitro antimicrobial effect on *S. zooepidemicus* and *A. equuli* after nebulization

Limitations/bias

- Effect of airways' anatomy, airflow, mucus and epithelial cells
- Potential toxicity on horse's respiratory cells and effect of long-term use on airway
- Uncommon silver-resistance bacteria described

Further studies

- Biocidal effects on viruses and fungi
- Cytotoxicity of silver citrate on equine respiratory epithelial cells
- In vivo studies: antimicrobial effects of silver citrate and side effects on airways

BIOMARKER RESEARCH

NGAL: A new biomarker for renal injury & inflammation

van Galen G., Jacobsen S. Vinther A. M., Breinholt Laurberg M., Tvermose E., Broe - Brøndum R., Prior Theisen L., Berg L.

Large Animal Teaching Hospital, University of Copenhagen, Denmark
(current address: Sydney University, Australia)

Neutrophil gelatinase-associated lipocalin (NGAL)

- Structural marker for renal damage
- Added diagnostic value humans/dogs / cats
- Also linked to inflammation
- AKI and inflammation go often hand in hand

Objective:

Determine if and how NGAL increases following different local and systemical inflammatory conditions, with and without renal problems

Impossible d'afficher l'image. Votre ordinateur manque peut-être de mémoire pour ouvrir l'image ou l'image est endommagée. Redémarrez l'ordinateur, puis ouvrez à nouveau le fichier. Si le x rouge est toujours affiché, vous devrez peut-être supprimer l'image avant de la réinsérer.

Impossible d'afficher l'image. Votre ordinateur manque peut-être de mémoire pour ouvrir l'image ou l'image est endommagée. Redémarrez l'ordinateur, puis ouvrez à nouveau le fichier. Si le x rouge est toujours affiché, vous devrez peut-être supprimer l'image avant de la réinsérer.

Study 1 - LPS

Stored samples previous study
6 healthy horses

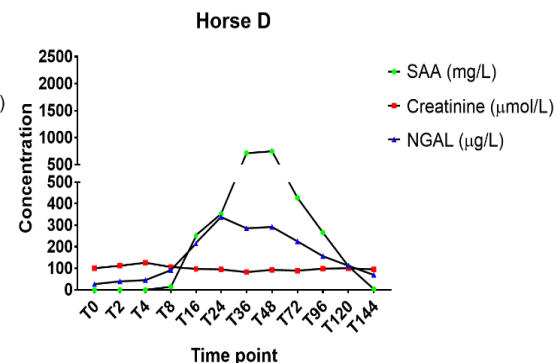

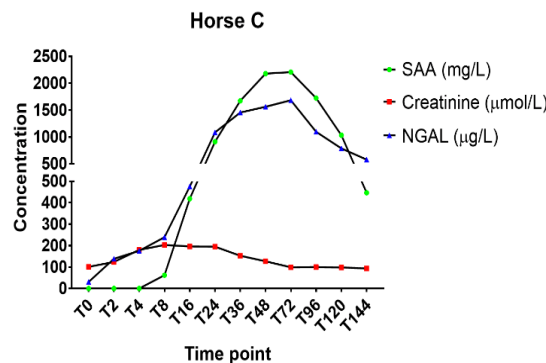

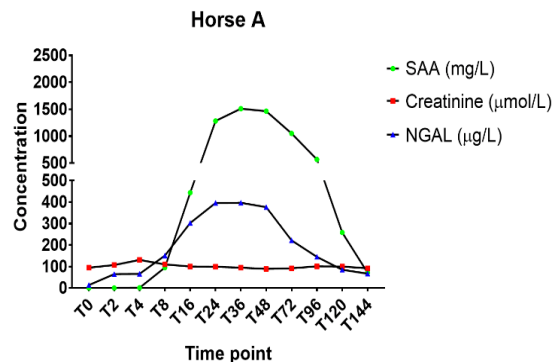

1ug/kg LPS IV

NGAL follows curve of SAA

- Low baseline
- Mild increase in 0-4H, then steep increase
- Peak at 24-48H (earlier than SAA)

Horse C has AKI : NGAL higher

-> identifies inflammation but also AKI

Study 3 – Overlap inflammation (I) & renal (R)

Frozen serum samples of all admissions
Retrospective case selection – 4 groups

Statistical difference between all groups, except R-/I- vs R+/I-
-> level of increase is indicative of type of lesion

Conclusion

- ✓ NGAL shows promising features as a new biomarker for renal issues and inflammation in the horse
- ✓ NGAL gives an indication of whether there is inflammation and/or renal damage
- ✓ A more clinically available diagnostic test is needed to enhance its clinical applicability

- 35 branches (29 USA, 6 Canada)
- 533 (144 current) Vets – 2132 vet-years
- Mixture FO/REF, racetrack and pleasure etc
- Jan 2006 – June 2017

Validated text-mining methodology: sensitivity and specificity ~99%

439,762 equids (horses, donkey, mules and zebras)

162,500 horses with >1 year clinical record

778,382 horse-years

Colic and LCI incidence (2006-2017)

35,406 colic episodes - 29,913 equids (8.1%; 95%CI:8.0-8.1%)

4452 LCI episodes – 4187 equids (12.6%; 95%CI:12.2-12.9%)

| Episodes | Colic (%) | LCI |
|----------|----------------|--------------|
| 1 | 26,082 (87.2%) | 3954 (94.4%) |
| 2 | 2782 (9.3%) | 206 (4.9%) |
| 3 | 687 (2.3%) | 23 (0.5%) |
| 4 | 217 (0.7%) | 3 (0.1%) |
| 5 | 81 (0.3%) | 1 (0.1%) |
| >5 | 64 (0.2%) | 0 |

90-days colic-free cut-off

Colic

- Less frequent in winter
- Dip in prevalence in spring reflection of greater overall caseload in that season

LCI

- Most common in Autumn (Nov-Dec)
- Occurrence decreases gradually through winter towards spring
- Peak in occurrence in August

Conclusion

- ✓ Big data from a large equine population can be used to evaluate seasonal occurrence of colic and LCIs
- ✓ Future studies should evaluate specific season related variables to inform improved prevention
- ✓ The study shows that LCIs are more common during certain times of the year and therefore owners and horse carers should be particularly vigilant during these times to prevent disease occurrence

Questions

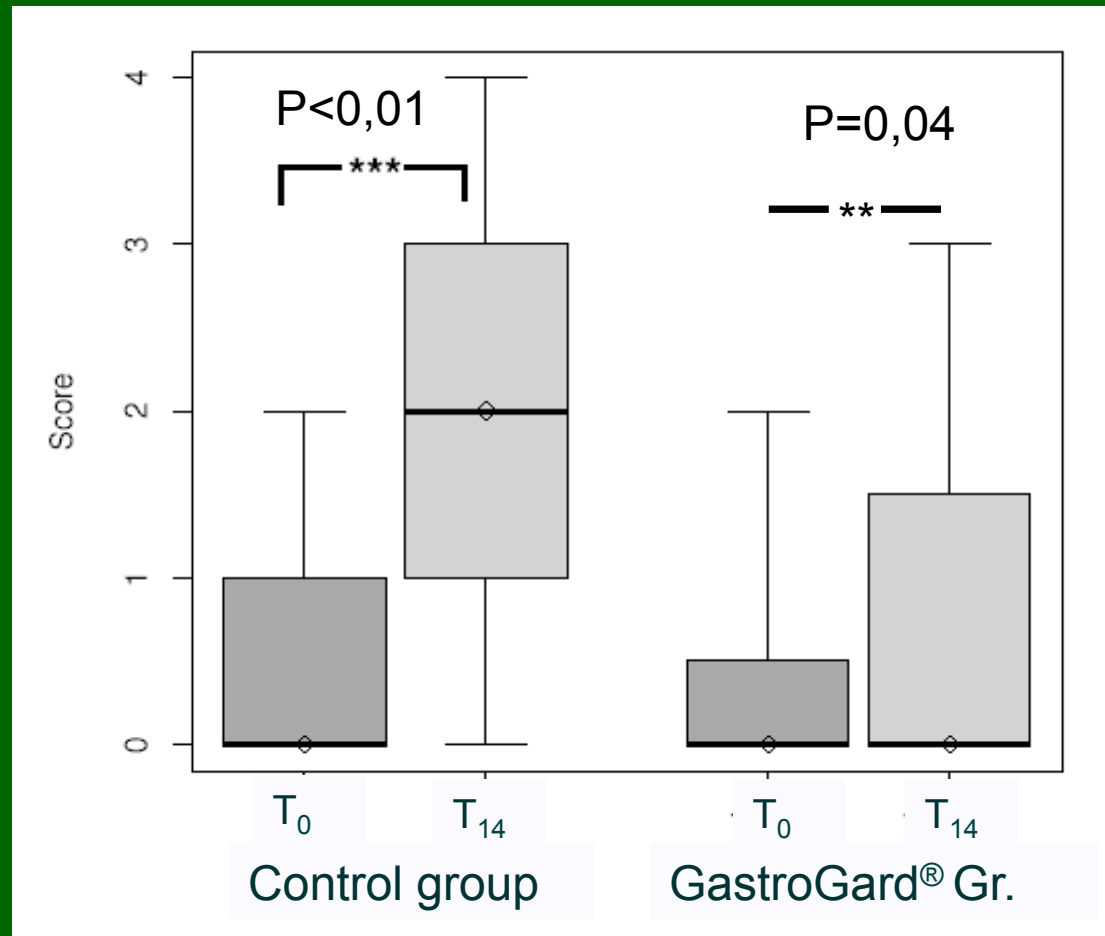

- ▶ Do foals show gastric ulcers around the weaning ?
- ▶ Does treatment with Gastrogard[®] decrease gastric lesions in foals after weaning ?
- ▶ Does feeding with a yeast enriched supplement EQI[®]Gastro decrease gastric lesions in foals after weaning ?

Trial 1: Study design

- ▶ 2 groups of 20 foals:
 - GastroGard® group: day 1 - 14, 2 mg/kg p.o. s.i.d.
 - Controls without therapy
- ▶ Feeding: hay / oats / soybean meal / minerals + vitamins
- ▶ Gastroscopy (*examiner blinded to group assignment*):
 - 1 day prior to weaning
 - 14 days post weaning

1. Trial : Results - Gastroscopy

Score:
squamous region

1. Trial : Results - Gastroscopy

Score: Pylorus

2. Trial : Study design

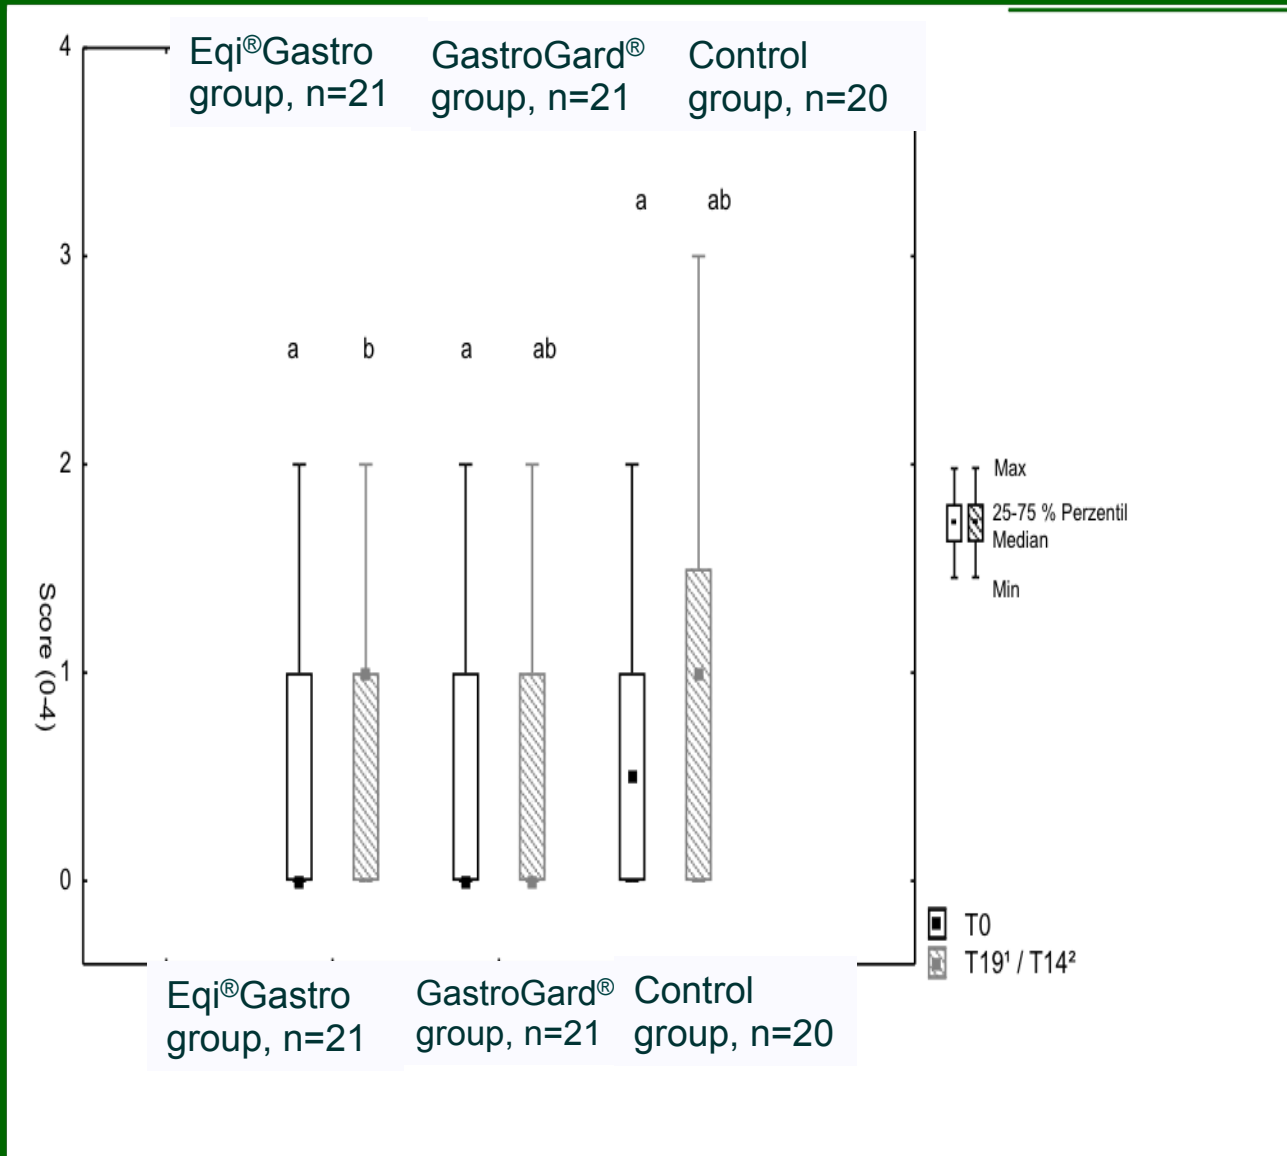

- 3 groups: 62 foals (5 - 6 months of age)
 - 1) Supplementation with EQI[®]Gastro (n = 21)
 - 2) Treatment with GastroGard[®] (n = 21)
 - 3) Controls (n = 20)
- Treatment / Supplementation :
 - EQI[®] Gastro: 19 days bid
 - GastroGard[®]: 14 days sid, 2 mg/kg BW
- Feeding method:
 - in the trough, in a soaked compound feed

Background to the yeast enriched supplement

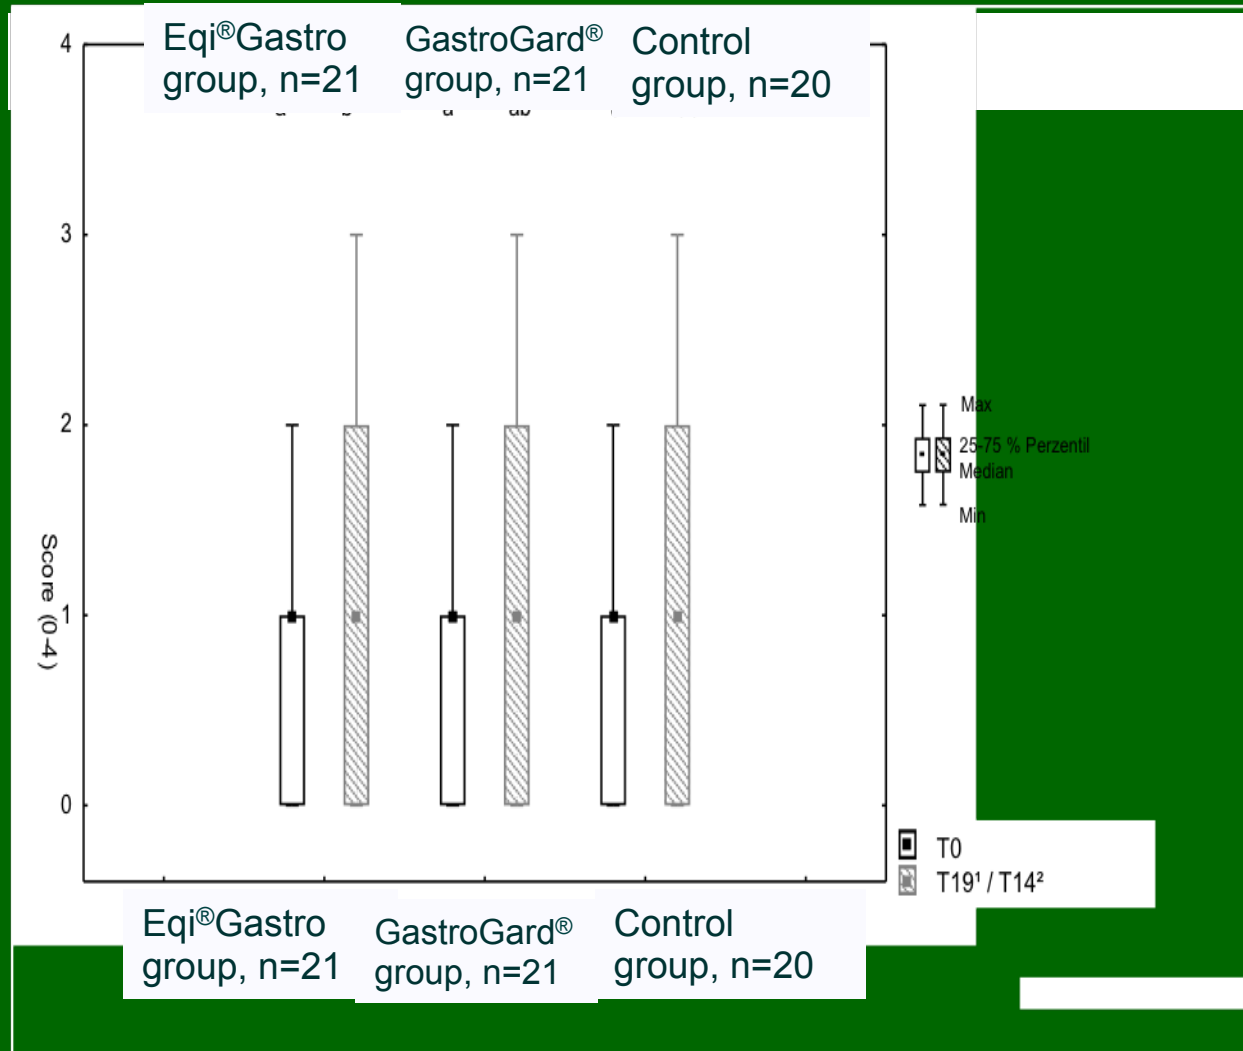

- *Saccharomyces cerevisiae*
- Pectin provided as apple pulp
- Algae
- Wheat bran
- Linseed

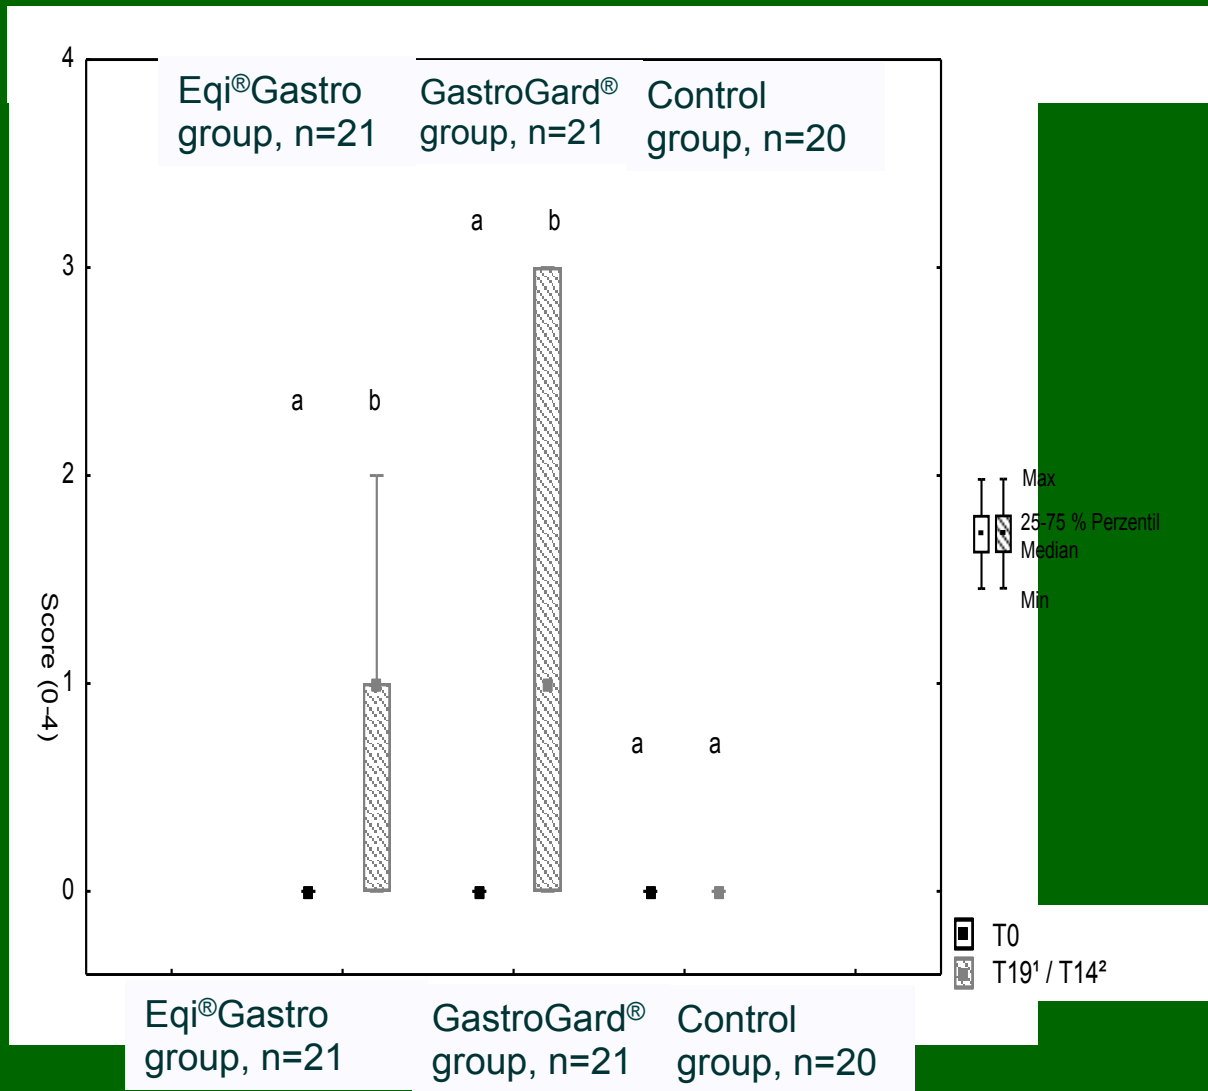

Part 2: squamous region - Larger curvature

Part 2: squamous region - small curvature

Part 2: Pylorus

Questions and answers

- ▶ Foals show gastric ulcers before and after weaning
- ▶ Does treatment with Gastrogard[®] decrease gastric lesions in foals after weaning ?
 - Yes in the squamous region (1. trial)
 - 2 studies → signs of inflammation at the pylorus
- ▶ Does feeding with a yeast-enriched supplement decrease gastric lesions in foals after weaning ?
 - Neither in the squamous nor in glandular region

CONCLUSION

91

- These results suggest that transabdominal ultrasonographic standards differ significantly between horses and small equids. These differences should be taken into account for an accurate diagnosis.
